**NEW QUESTION 27**

Your organization has a Microsoft 365 E5 subscription. You create a Microsoft Purview sensitivity label named Label1. You need to ensure that users can apply Label1 to files in Microsoft 365. What should you use?

- A. an auto-labeling policy
- B. a trainable classifier
- C. a retention label policy
- D. a sensitivity label policy

**Answer:** D

**Explanation:**

The correct answer is D. a sensitivity label policy. In Microsoft Purview, creating a sensitivity label by itself does not make it available to users. Microsoft Learn states that after you create sensitivity labels, you must publish them by creating a label policy so that users and groups can see and apply those labels in Microsoft 365 apps and services. Publishing controls which labels are available and to whom they are shown. This is why a sensitivity label policy is required to ensure that users can apply Label1 to files.

The other options do not meet the requirement. Auto-labeling policies apply labels automatically when content matches conditions, but they are not the primary mechanism for simply making a label available for user selection. A trainable classifier is used to identify content categories, not to publish a label. A retention label policy publishes retention labels for records and lifecycle purposes, which is different from sensitivity labeling for classification and protection. Therefore, the correct Microsoft-documented method to let users apply Label1 to files is to publish it using a sensitivity label policy.

**NEW QUESTION 29**
